Command Prompt

DATA 301 Introduction to Data Analytics Command Line

Dr. Ramon Lawrence University of British Columbia Okanagan ramon.lawrence@ubc.ca

Why learn the Command Line?

The *command line* is the text interface to the computer.

Understanding the command line allows you to interact with the computer in ways that you often cannot with the user interface.

The command line is commonly used for scripting and automation of tasks and when accessing remote systems.

What is the Command Line?

The *command line* is the text interface to the computer that accepts commands that the computer will execute. These commands include:

- starting programs
- navigating directories and manipulating files
- searching, sorting, and editing text files
- system and environment configuration

The command line is part of the *operating system*, which is software that manages your computer including all devices and programs.

• Common operating systems include Windows, Mac OS, and Linux/Unix.

Windows Command Line

The command line on Windows dates back to the original Microsoft operating system called **DOS** (**Disk Operating System**) in 1981.

This command line interface is still part of all modern Windows operating systems and is accessible as the "Command Prompt".

It is commonly used for system administration and scripting.

DATA 301: Data Analytics (5)

DATA 301: Data Analytics (3)

Mac OS Command Line

The command line for Mac OS uses the same commands as Linux. It can be opened using Finder then Utilities then Terminal.

Data Command Line – Mac/Linux Prevence - bash - 55×17 A4003829:~ rlawrenc\$ pwd /Users/rlawrenc A4003829:~ rlawrenc\$ echo Hello Hello A4003829:~ rlawrenc\$ mkdir 301 A4003829:~ rlawrenc\$ d301 A4003829:301 rlawrenc\$ ls test.txt A4003829:301 rlawrenc\$ cat test.txt This is a test! A4003829:301 rlawrenc\$ cat test.txt A4003829:301 rlawrenc\$ cd A4003829:~ rlawrenc\$ cd A4003829:~ rlawrenc\$ mtir 301 A4003829:~ rlawrenc\$	Data Analytics (7) Entering a Comman Enter a command at a p The prompt may be a > c customized by the user. Press ENTER to execute command. On Windows, command mostly case-insensitive Mac/Linux they are case sensitive.	Adou3829:~ rlawrenc\$ echo Hello Hello Adou3829:~ rlawrenc\$ echo Hello Hello Adou3829:~ rlawrenc\$ echo Hello Hello Adou3829:~ rlawrenc\$ echo Hello Hello Adou3829:~ rlawrenc\$ d301 Adou3829:301 rlawrenc\$ ls test.txt Adou3829:301 rlawrenc\$ ls test.txt Adou3829:301 rlawrenc\$ cat test.txt This is a test! Adou3829:301 rlawrenc\$ cat test.txt This is a test! Adou3829:301 rlawrenc\$ cat test.txt Adou3829:301 rlawrenc\$ cat test.txt Adou3829:301 rlawrenc\$ cat test.txt Adou3829:301 rlawrenc\$ cat. Adou3829:301 rlawrenc\$ cat. Adou3829:301 rlawrenc\$ cd Adou3829:~ rlawrenc\$ mdir 301 Adou3829:~ rlawrenc\$ I
File System Image: System I	: Data Analytics (9) Absolute versus R device as The root of the file system of the result of the resul	en is the directory "/". a directory hierarchy. n (from your current location) can be specified m the root: rlawrenc/301/folder your current location: /folder y level, use the command: cd

DATA 301: Data Analytics (**11**)

Absolute versus Relative Path Question

Question: Given this directory hierarchy and that the user is currently in the directory level2 and level1 directory contains a file test.txt. How many of the following statements are **TRUE**?

1) A relative path to change to directory 301 is . . 2) Absolute path to test.txt is /Users/rlawrenc/301/level1/test.txt

3) Relative path to test.txt is .../test.txt

4) Relative path to ${\tt test.txt}$ is different if user was currently in ${\tt level3}$ directory.

5) There is only one root of the directory hierarchy.

A) 0 **B)** 1 **C)** 2 **D)** 3 **E)** 4

DATA 301: Data Analytics (12)

Commonly Used File Navigation Commands

	Windows	Mac OS and Linux
List contents of directory	dir	ls
Change directory	cd 301	cd 301
Print working directory	cd	pwd
Make a directory	mkdir <i>301</i>	mkdir <i>301</i>
Remove a directory	rmdir 301	rmdir 301
Rename a file	ren old.txt new.txt	mv old.txt new.txt
Remove a file	del file.txt	rm file.txt
Copy a file	copy src.txt dest.txt	cp src.txt dest.txt

DATA 301: Data Analytics (14)

DATA 301: Data Analytics (13)

Commonly Used Text Related Commands

	Windows	Mac OS and Linux
Open a text editor	notepad	nano
Echo output	echo <i>Hello</i>	echo <i>Hello</i>
Output contents of a file	more file.txt	cat file.txt
Search text files	find	grep
Sort text files	sort	sort

Wildcards

A *wildcard* character allows for matching file names with more flexibility.

The ? represents any *one* character in a file name. Example: file?.txt would match file1.txt.

The * (asterisk) matches any number of characters (including zero). Example: *.txt would match anything ending with .txt (a.txt).

Navigating the Command Line

	Windows Key	Mac OS Key
Previous command in history	Up	Up
Next command in history	Down	Down
First command in history	PageUp	
Last command in history	PageDown	
Move to start of line	Home	Ctrl+A
Move to end of line	End	Ctrl+E
Auto-compete file name	Tab	Tab

Pausing or Cancelling Commands

To **pause** a command:

- Windows: Press Ctrl+S or the Pause key. To resume, press any key.
- Mac: Control+Esc or Command+.

To cancel a command, press Ctrl+C or Ctrl+Break.

- The command is canceled, and the command prompt returns.
- However, any actions performed before the cancel are not undone.

DATA 301: Data Analytics (15)

Command Shortcuts Question

Question: How many of the following statements are TRUE?

- 1) To cancel a command, press Ctrl+X.
- 2) To go to the next command in the history, press ${\tt Up}\;\;{\tt arrow}.$
- 3) This wildcard expression te*a?.txt matches teal2.txt.
- 4) The command to change a directory is ${\tt pwd}.$

A) 0 B) 1 C) 2 D) 3 E) 4

DATA 301: Data Analytics (16)

Try it: Navigating Directories with Commands

Question: Using a terminal window on your computer, perform the following actions:

- 1) Create a directory called 301.
- 2) Change into the directory 301.
- 3) EchoI am awesome!
- 4) Show your current directory (print working directory).
- 5) Create a text file called ${\tt message.txt}$ with a message in it.
- 6) List the contents of your directory.
- 7) Rename the file ${\tt message.txt}$ to test.txt. Verify the name change.
- 8) Delete the test.txt file.
- 9) Change directory to directory above 301.
- 10) Delete directory 301.

<section-header>DATA 301: Data Analytics (19) Command Arguments A command can take <i>arguments</i> that changes its behavior. • Example: Path was an argument for the cd command. e.g. cd 301 On Windows, commands also can be modified by a <i>switch</i> (or extension) which is usually a slash then a letter (e.g. / S). • To find out what is available, run the command with: /? Memoryses (deletes) a directory. (b) [\$ (.j) [1] (J) [d] (rei;) path</section-header>	DATA 301: Data Analytics (20) Command Arguments – Mac/Linux On Mac/Linux, arguments are separated by spaces and begin with –. An explanation of arguments can be found by using man then the command name. Example: man cp O(1) Created by Spaces and begin with –. An explanation of arguments can be found by using man then the command name. Example: man cp O(1) Created by Spaces and BSD General Commands Manual O(1) Created by Spaces and BSD General Commands Manual O(1) Created by Space and Created b
A Quiet mode, do not ask if ok to remove a directory tree with /S C:\Users\rlawrenc>_ DATA 301: Data Analytics (21) Standard Input. Output. and Error	DESCRIPTION In the first synopsis form, the cp utility copies the contents of the <u>source file</u> to DATA 301: Data Analytics (22) Redirecting Input
Standard input (stdin) is the default input device (usually a keyboard) into the terminal.	By default, a command gets its input from standard input and outputs results to standard output.
Standard output (stdout) is the location where output is sent after a command is run. The default is the terminal window.	A command can get its input from the output of another command by using the pipe () symbol. Example:
<i>Standard error</i> (stderr) is the location where error messages are displayed (typically the terminal window).	Also can use redirect input (<) to send input to a command. Example: cat < test.txt Note that can chain together multiple pipes. • Note the example commands are Mac OS/Linux only: wc is not on Windows.
DATA 301: Data Analytics (23)	DATA 301: Data Analytics (24) Redirection Summary
Redirect output using > which will overwrite the file.	
Redirect output using > which will overwrite the file: sort test.txt > sorted.txt Use >> to append to the existing file: sort test.txt >> sorted.txt	SymbolRedirect input<Redirect output>Redirect output (append)>>Pipe output to input of next command

DATA 301: Data Analytics (25) Escape Symbol is used when a command requires input that contains a character with a special meaning. The escape symbol indicates this character is data not part of the command. • On Windows, the caret (^) indicates that whatever character that follows it is data rather than part of the command. Example: cp test.txt a^&b.txt • On Linux, use the backslash (\).	DATA 301: Data Analytics (26) Environment Variables Environment variables allow for customization and control of the command and system environment. Current variables are seen using the set or env command.
This is especially common when dealing with spaces in a file name. The other way to handle file names with spaces is to enclose them in double quotes: cp test.txt "c:\program files\file spaces.txt"	 \$PATH - list of directories where commands/applications will be found \$HOME - user home directory
DATA 301: Data Analytics (27) Finding Text in Files	DATA 301: Data Analytics (28) Batch Files
<pre>The grep command allows for searching for text in files that match a pattern (Mac/Linux only, find on Windows). grep stands for "global regular expression print" Search is case-sensitive (use -i for case-insensitive) and can contain regular expressions. Example: grep er *.txt - search for er in any file that ends in .txt Windows: find "er" *.txt</pre>	A batch program (also commonly called a <i>batch file or command file</i>) is a text file that contains a sequence of commands to be executed. You define the sequence of commands, name the sequence, and then execute the commands by entering the name at a command prompt. Any action you can take by typing a command at a command prompt can be encapsulated in a batch program. In Windows files typically end in .bat or .cmd and on Mac/Linux with .sh. Batch files can take arguments like other commands.
Data 301: Data Analytics (29) Connecting to Another Computer using SSH Secure shell or SSH is a protocol allowing remote login to other machines to execute commands. • The network communication is encrypted for security. • An open-source program on campus is Putty. Using SSH allows you to connect and execute commands on another machine even when you do not have physical access to that machine. SSH may be used to send or retrieve data from other computers for analysis.	 DATA 301: Data Analytics (30) Try it: Using Batch Files Question: Using a terminal window on your computer, create a batch file that performs these actions: Before creating the batch file, create a file called numbers.txt that has the numbers one, two, three,, ten. In the batch file, called myscript.bat (or .sh): 1) Write a command to sort numbers.txt and output as sorted.txt. 2) Write a command to output the word count on numbers.txt to count.txt. 3) Write commands to take numbers.txt and append its data three times into the file output.txt. 4) Use grep to search for "e" in output.txt and write results as file search.txt. 5) Run your batch file.

DATA 301: Data Analytics (31)

Conclusion The *command line* is the text interface to the computer that accepts commands that the computer will execute including running programs, manipulating files, and running scripts.

The command line allows for automation and more control than may be available in the user interface. It may also be the only way to interact with the machine if connecting via SSH.

The command environment allows for redirecting the standard input and output using input/output redirection and pipes.

Objectives

- Define command line and list some of its uses
- Explain the purpose of an operating system
- Know how to open the command line window on Mac OS and Windows
- Be able to enter commands and stop them
- Define: file system, folder, file
- Explain the difference between an absolute and relative path
- Use command line shortcuts to save time
- Be able to match wildcards involving ? and *
- Be able to cancel a command
- Explain standard input, standard output, and standard error
- Be able to use input and output redirection and pipes (?, >, < , >>)
- Explain the reason for an escape symbol
- Define and explain the purpose of environment variables.

DATA 301: Data Analytics (33)

Objectives (2)

- Be able to use grep to search text files.
- Explain the purpose of a batch program.
- Be able to connect to another machine using SSH.

DATA 301: Data Analytics (32)
